## Agenda

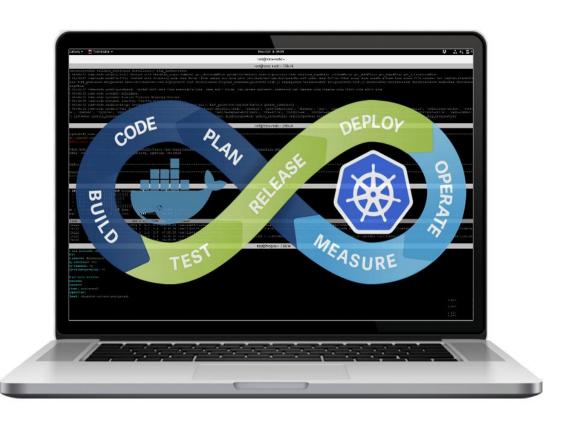

- Presentation
- Lab
- Q/A

#### Why?

- We need to scale
- Cloud scales by design and definition

#### How?

- Containers
- Orchestrator

#### The problem

- Monolith applications
- Applications are stateful
- Applications need to be scale-aware

#### **Solution**

- Microservice approach
- 12-factor applications
- Enterprise support

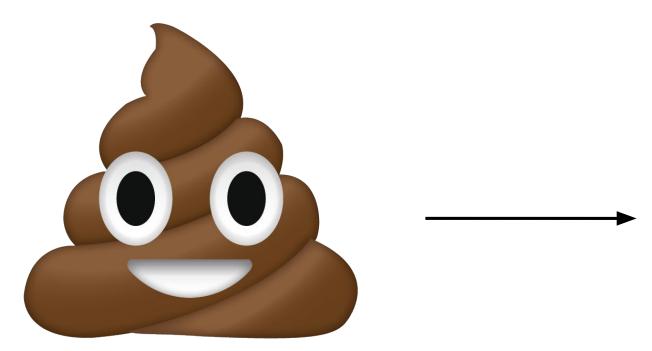

#### **Monolith**

#### **Monolith**

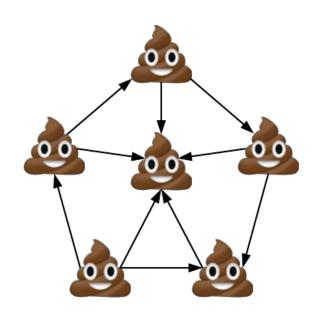

#### **Monolith**

#### **Microservices**

#### 12-Factor application

#### 12-Factor application

- 1.Codebase
- 2.Dependencies
- 3. Configuration
- 4.Backing Services
- 5.Build, Release, Run
- 6.Processes

- 7.Port Binding
- 8.Concurrency
- 9.Disposability
- 10.Dev/Prod Parity
- 11.Logs
- 12.Admin Processes

#### 12-Factor application

- 1.Codebase
- 2. Dependencies
- 3. Configuration
- 4.Backing Services
- 5.Build, Release, Run
- 6.Processes

7.Port Binding

13. Security currency

9.Disposability

10.Dev/Prod Parity

11.Logs

12. Admin Processes

#### 12-Factor application

1.Codebase

2.Dependencies

3. Configuration

4.Backing Services

5.Build, Release, Run

6.Processes

7.Port Binding

13. Security currency
9.Disposability
14. ???.Dev/Prod Parity
11.Logs
12.Admin Processes

#### The right tool for the right job

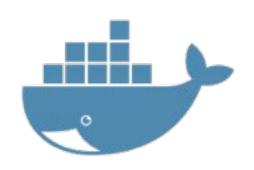

# Which are the de-facto standards in terms of DevOps?

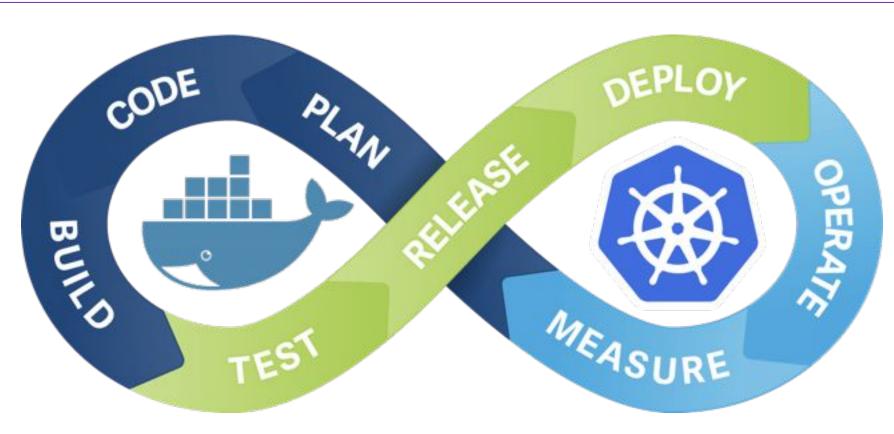

(hopefully opensource)

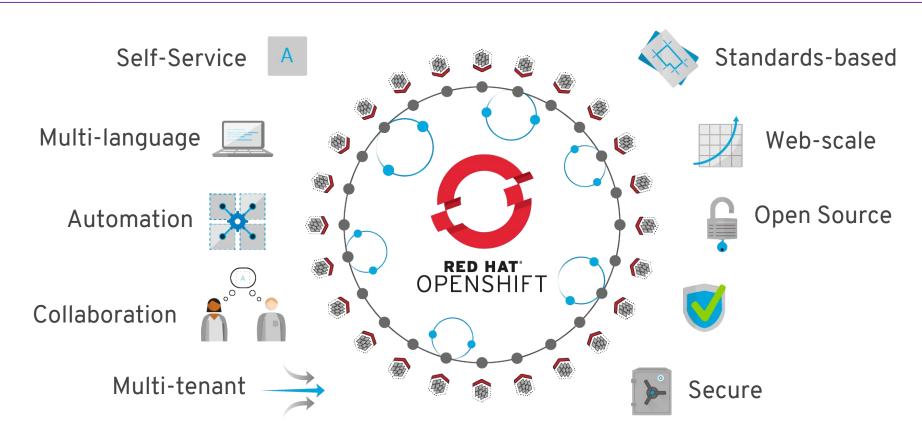

# Do we have a platform that merges the right tool for the right job?

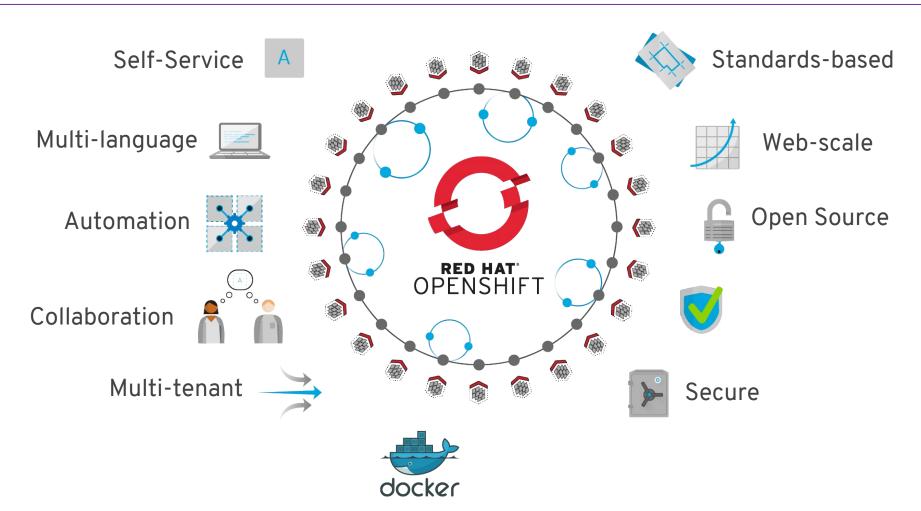

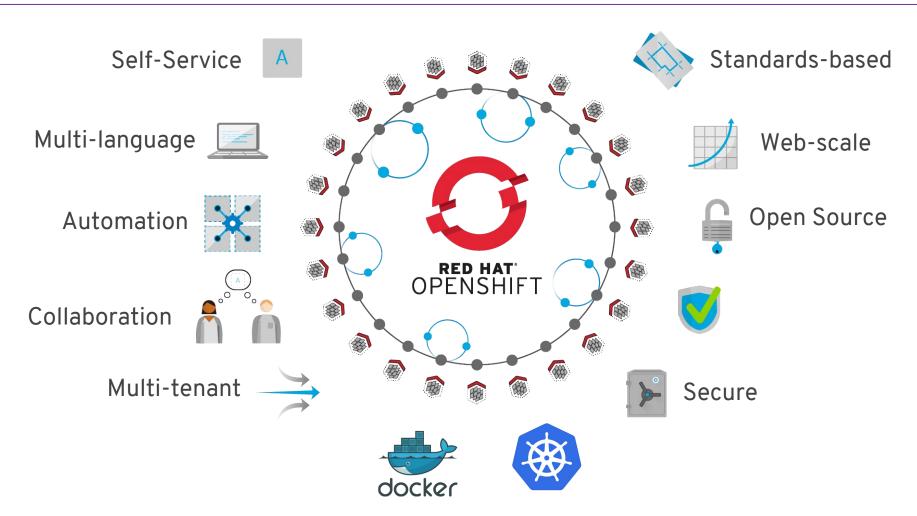

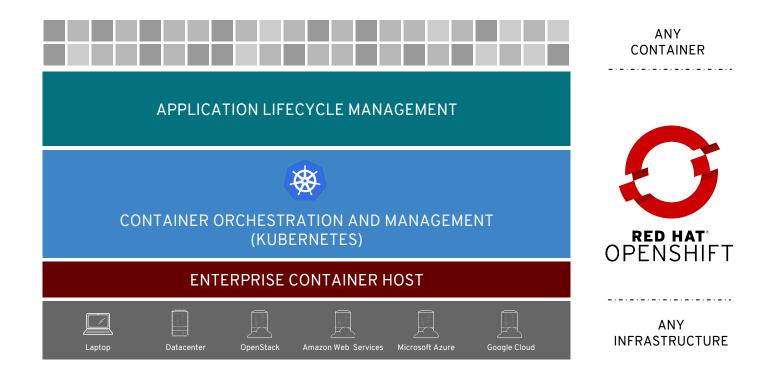

CRI-O is an implementation of the Kubernetes CRI (Container Runtime Interface) to enable using OCI (Open Container Initiative) compatible runtimes.

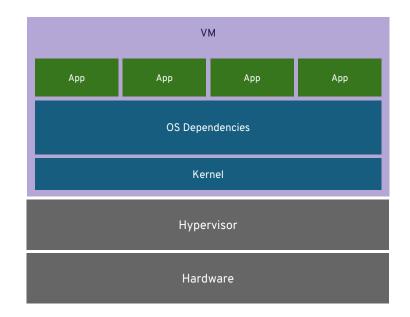

Optimized for Kubernetes

Any OCI-compliant container from any OCI registry (including docker)

Improve Security and Performance at scale

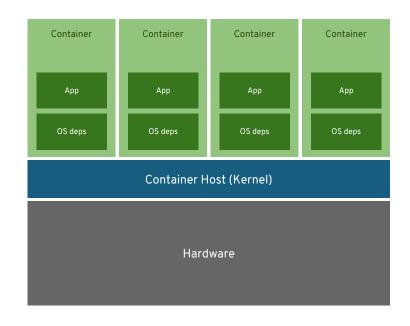

#### VIRTUAL MACHINES

VM virtualizes the hardware

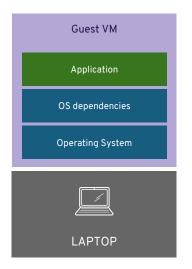

#### **CONTAINERS**

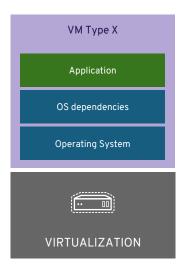

Container virtualizes the process

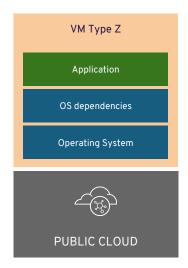

Virtual machines are NOT portable across hypervisor and do NOT provide portable packaging for applications

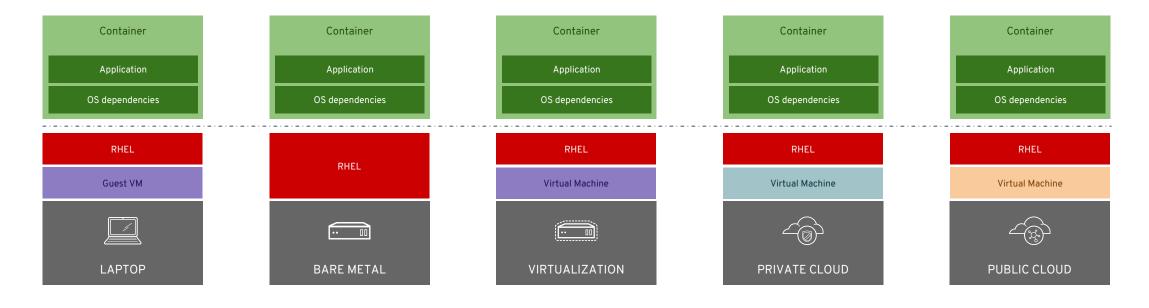

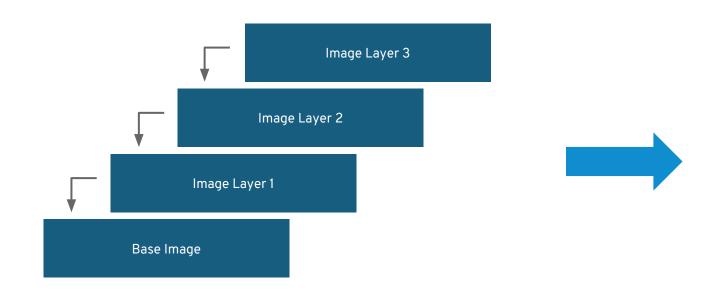

#### RHEL Containers + RHEL Host = Guaranteed Portability Across Any Infrastructure

Application Layer

Java Runtime Layer

OS Update Layer

Base RHEL

Container Image Layers

Example Container Image

#### A container is the smallest compute unit

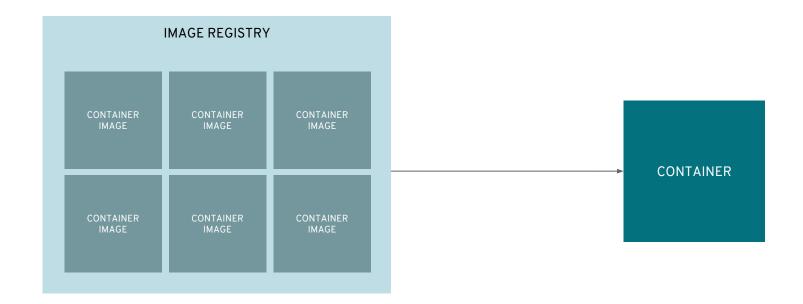

#### Containers are created from container images

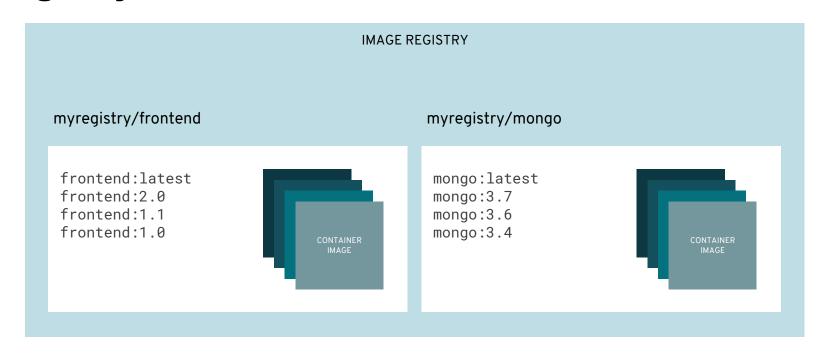

#### Container images are stored in an image registry

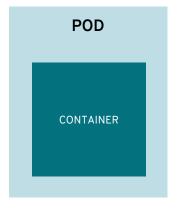

# An image repository contains all versions of an image in the image registry

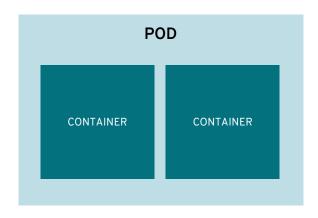

## Containers are wrapped in pods which are units of deployment and management

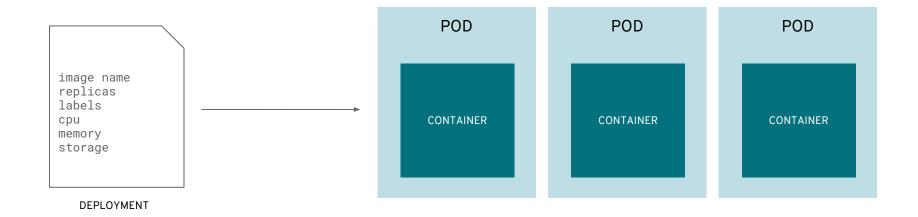

IP: 10.1.0.55

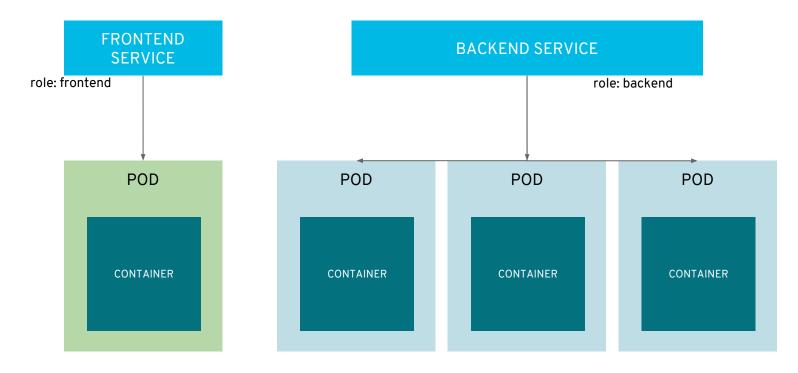

#### Pods configuration is defined in a deployment

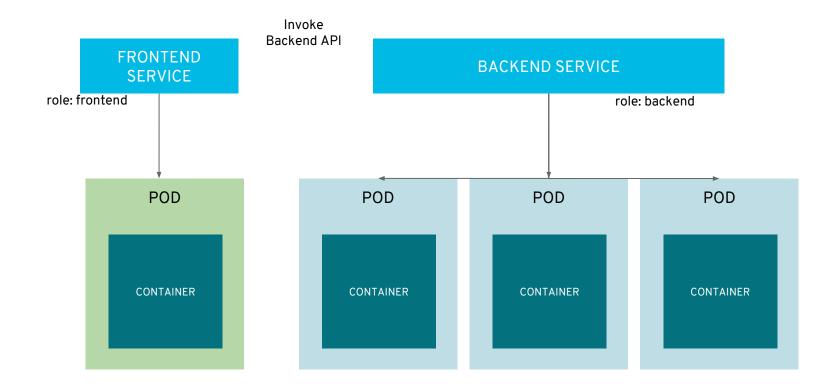

Services provide internal load-balancing and service discovery across pods

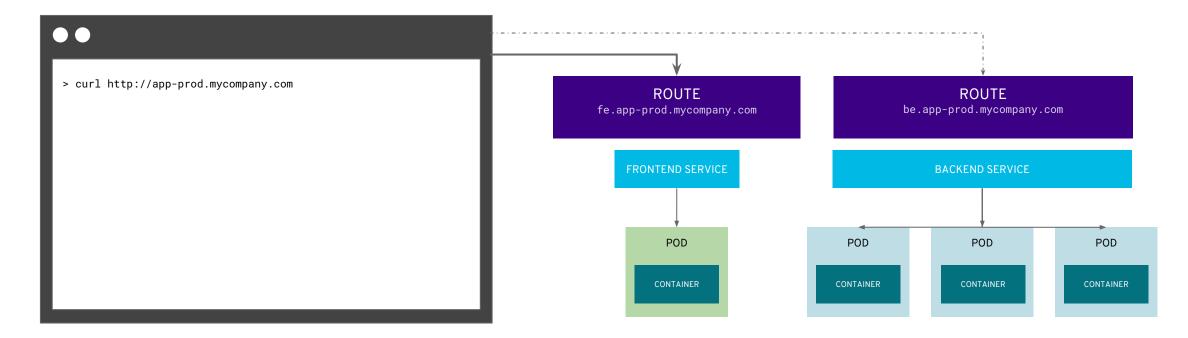

#### Apps can talk to each other via services

# Routes add services to the external load-balancer and provide readable urls for the app

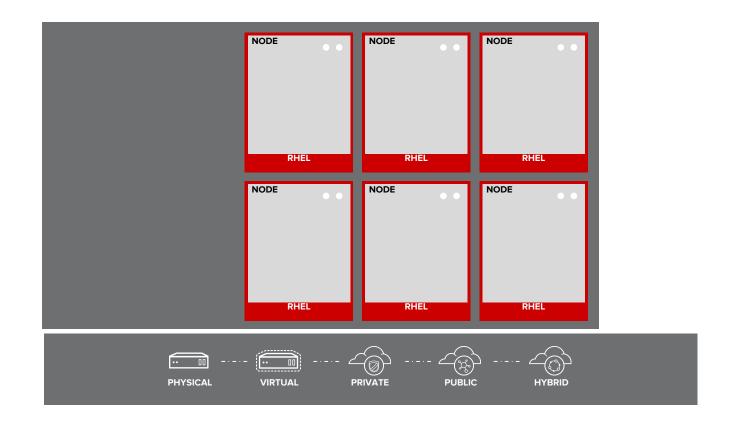

#### **OpenShift Architecture**

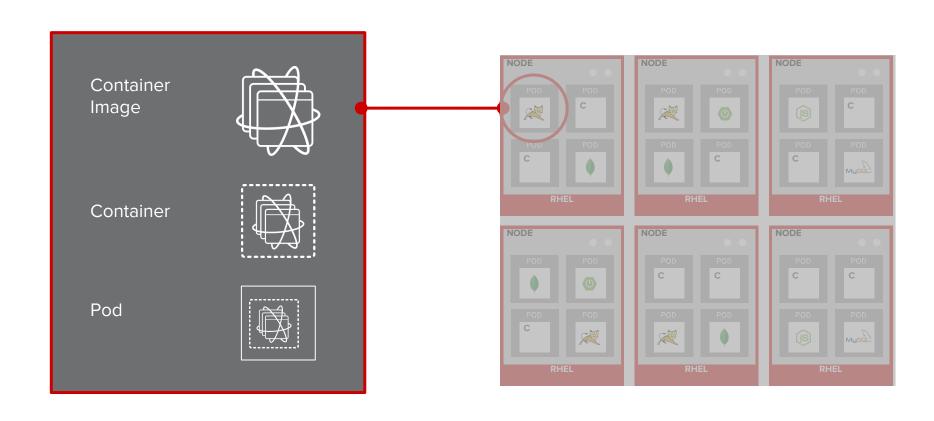

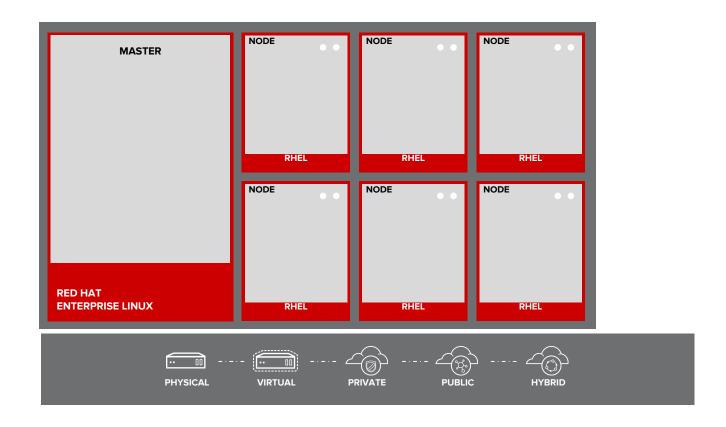

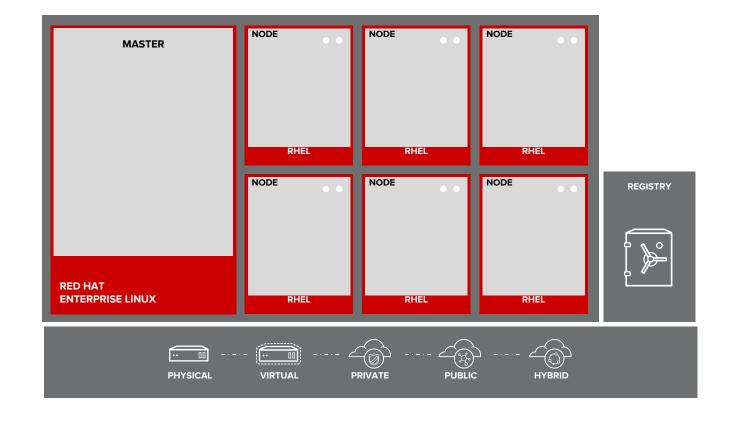

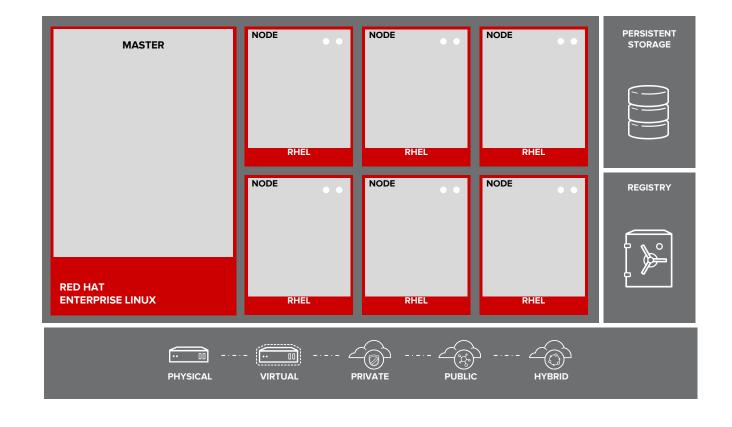

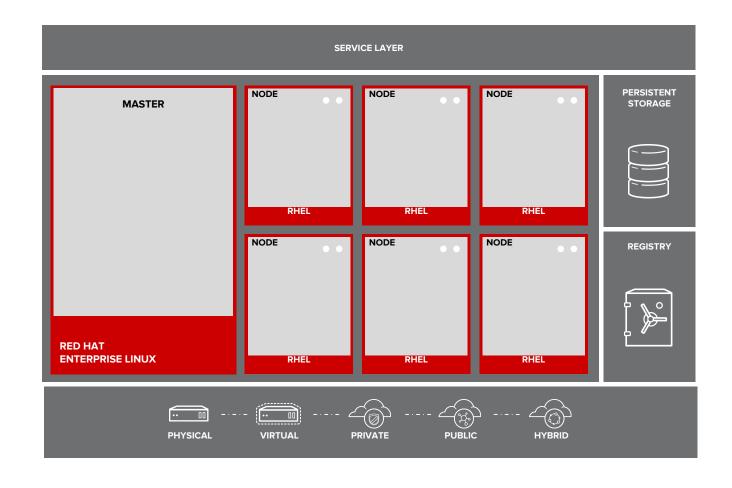

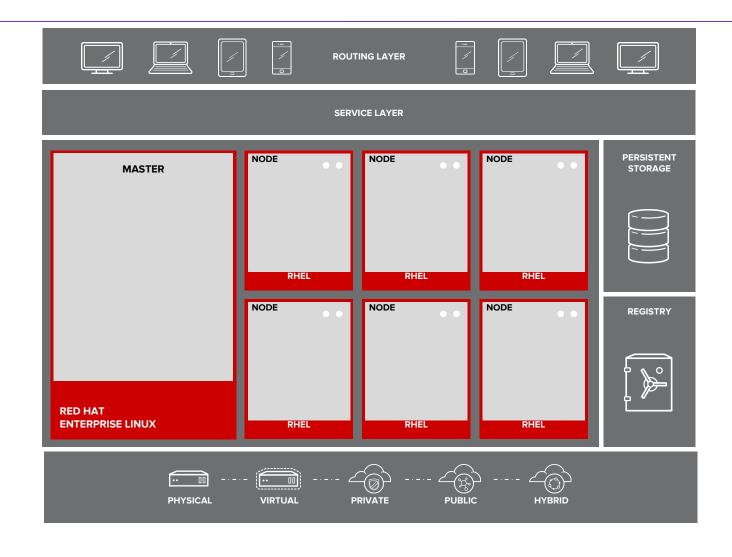

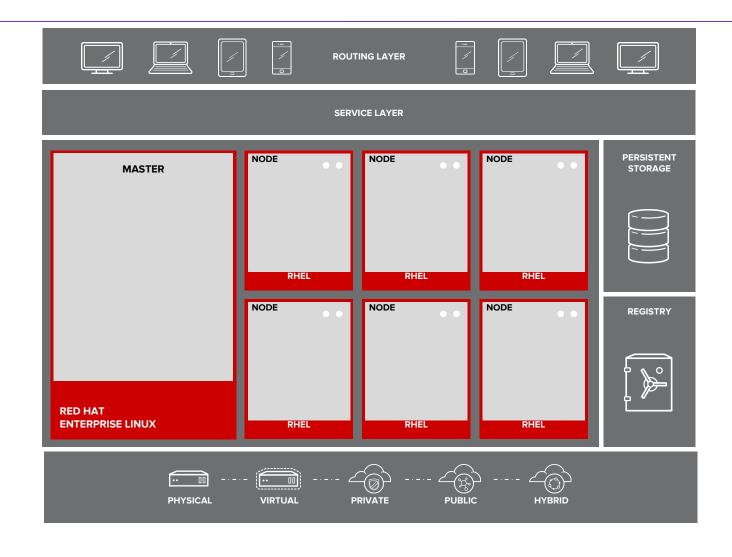

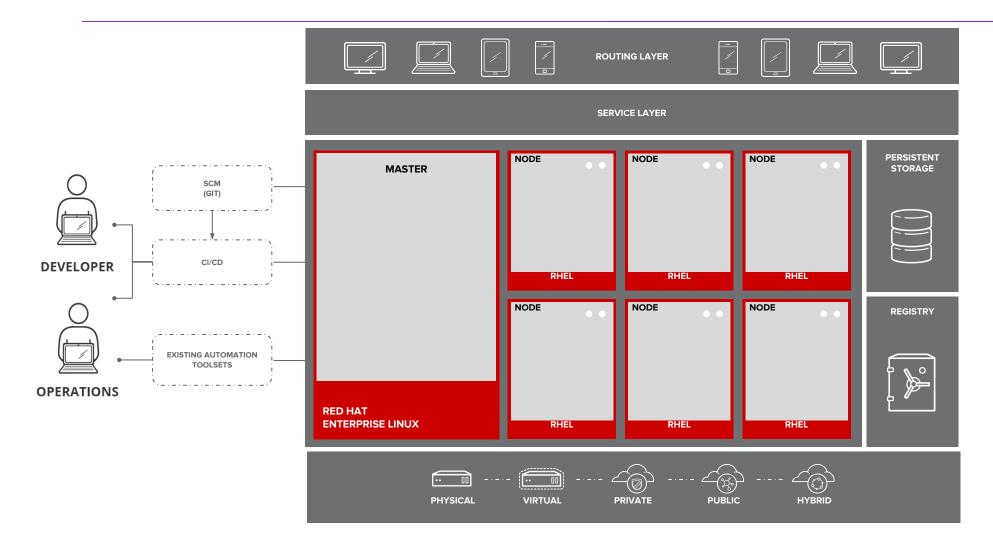

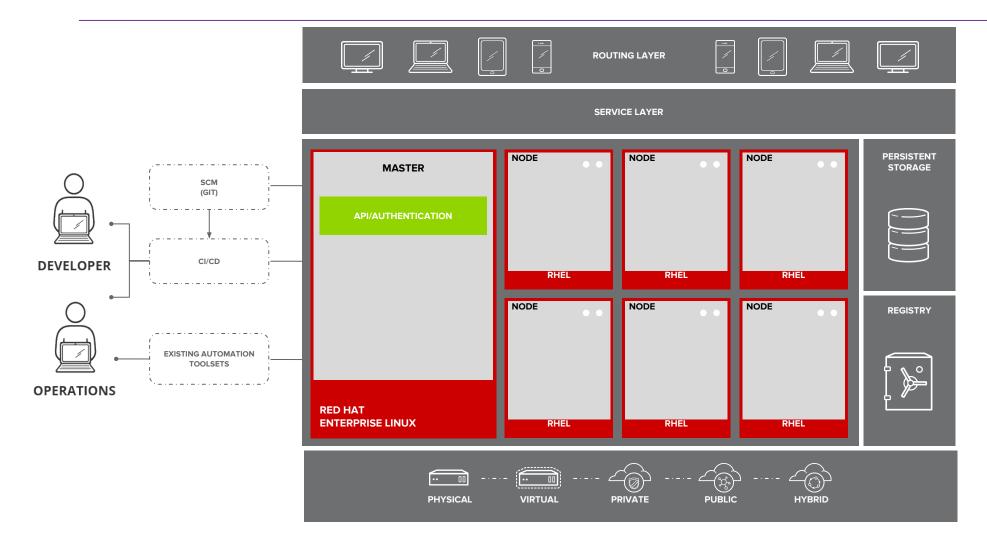

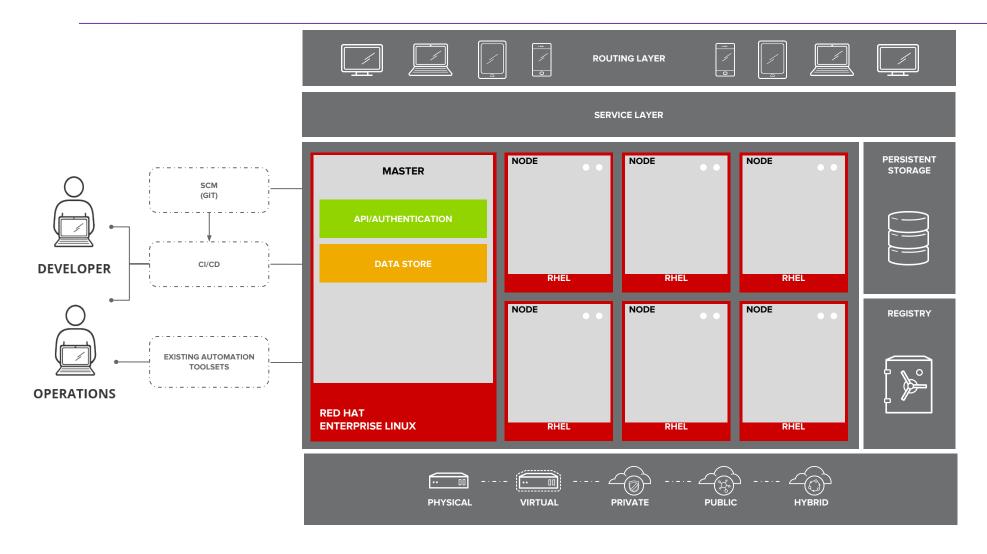

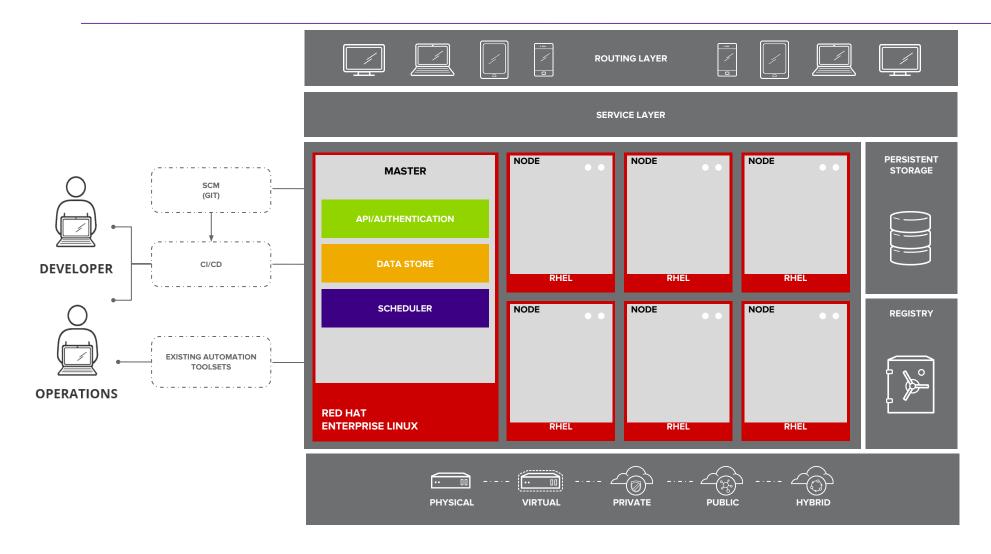

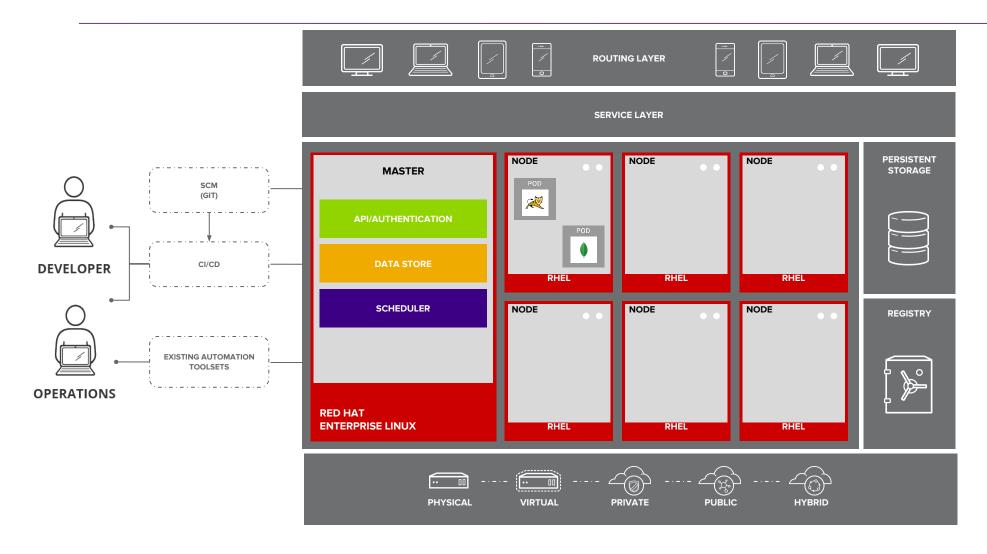

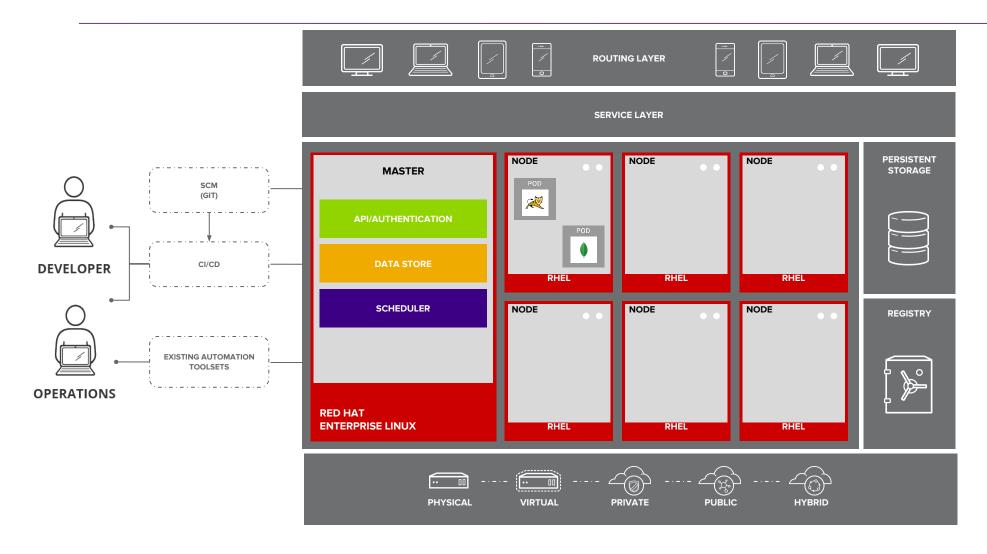

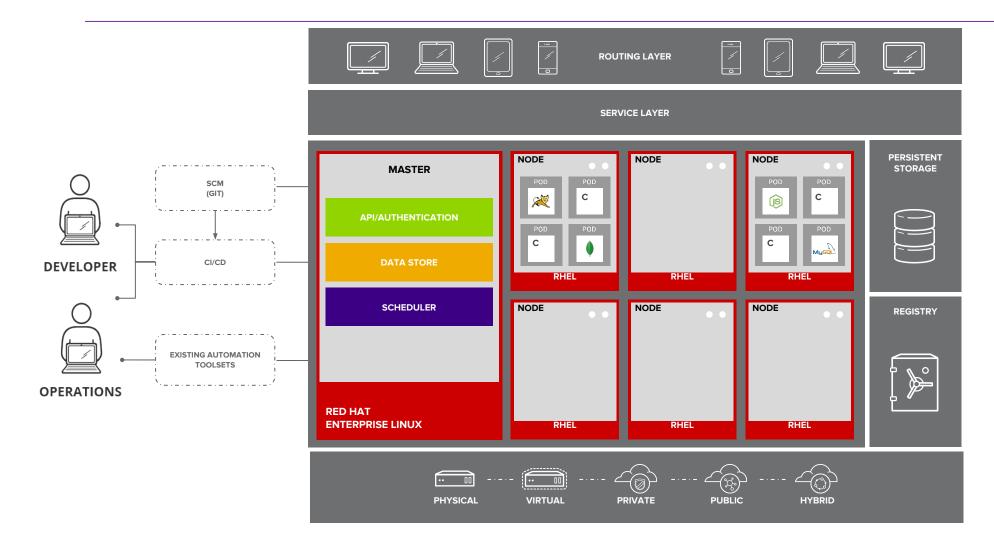

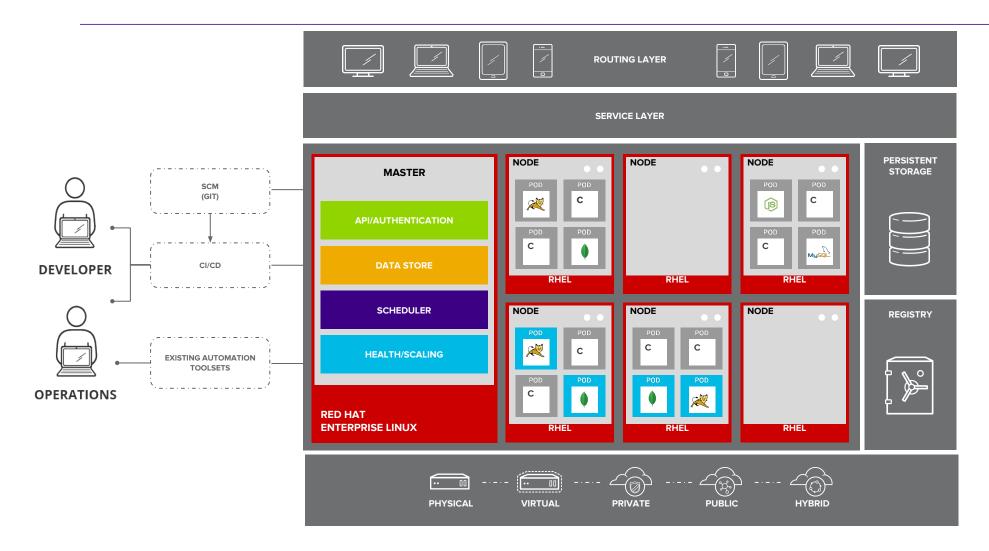

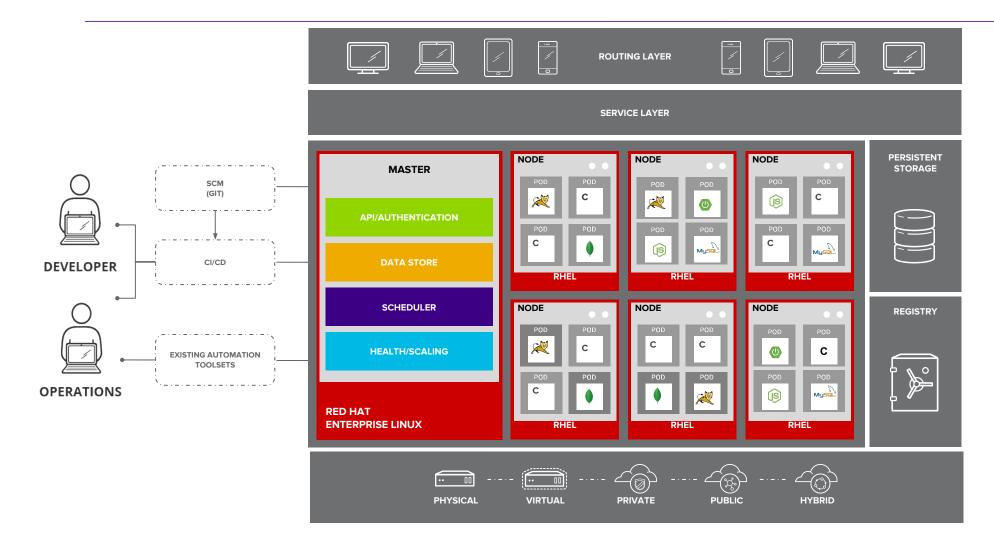

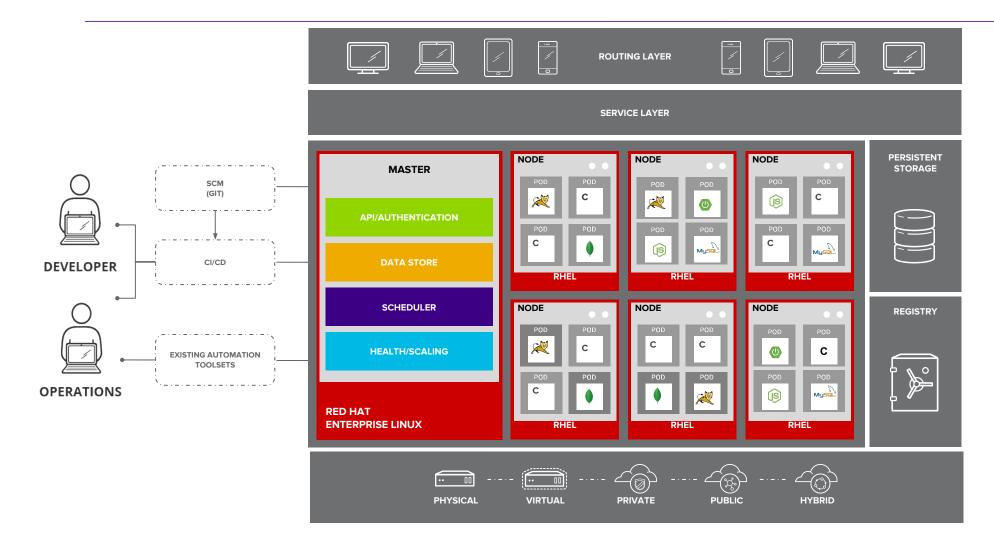

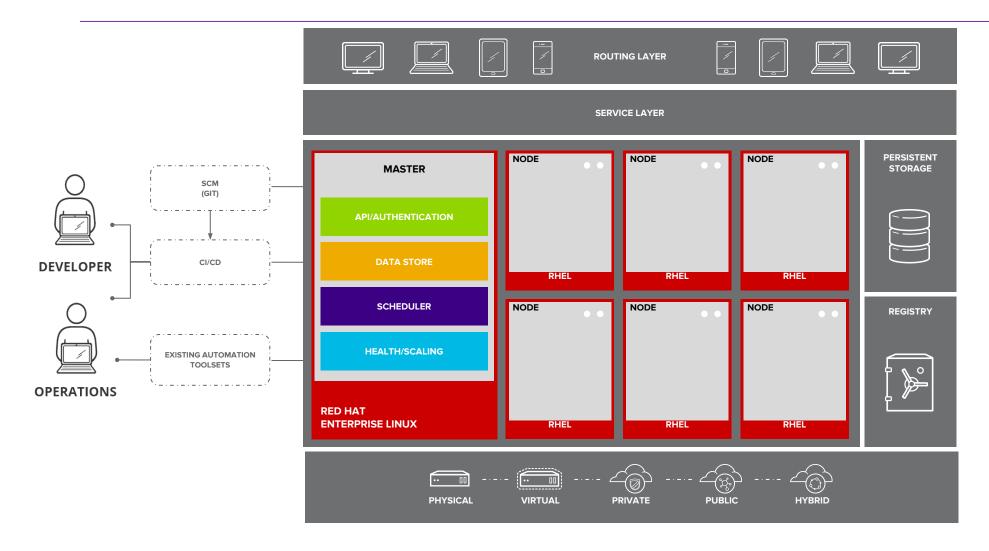

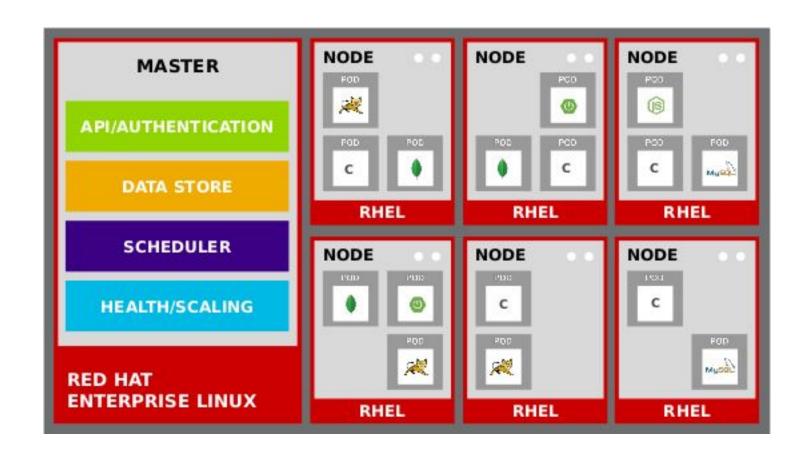

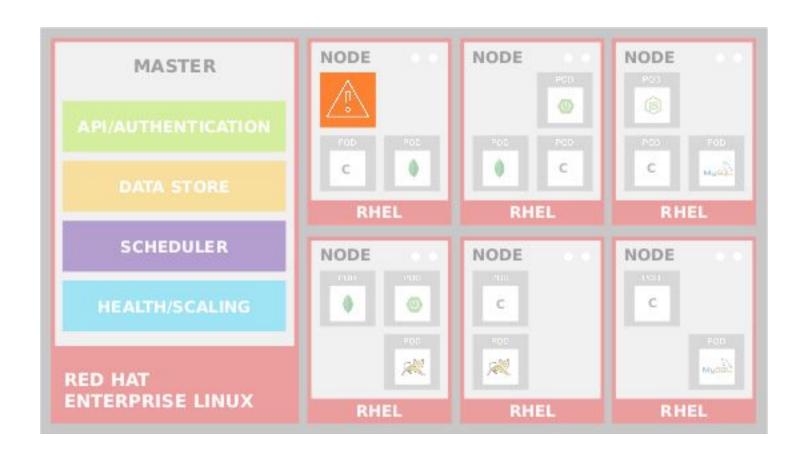

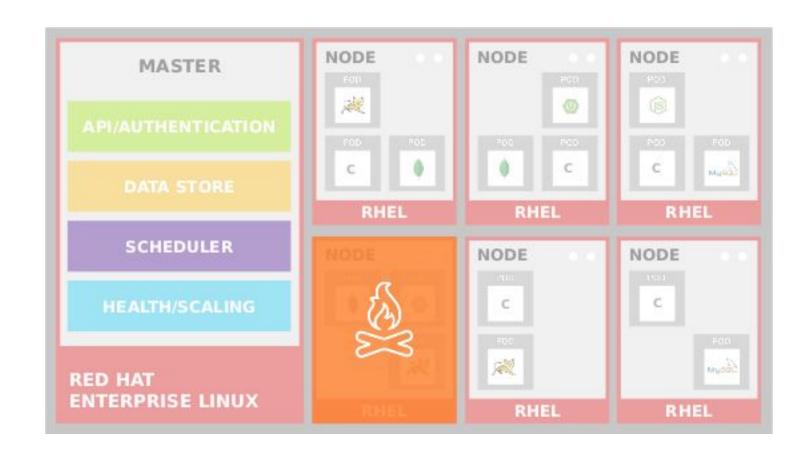

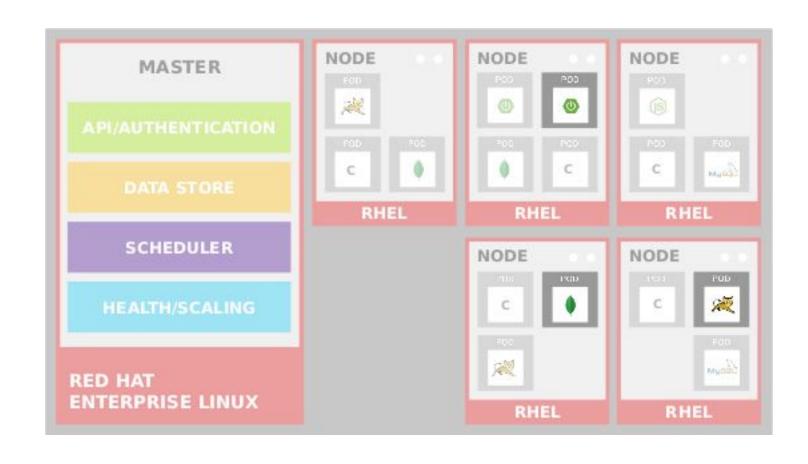

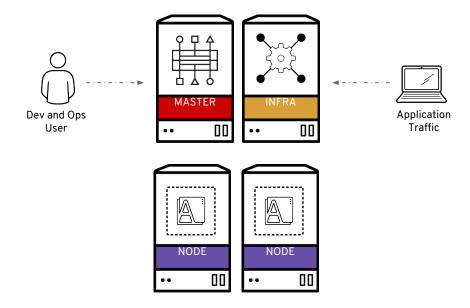

# OpenShift Installation Architecture

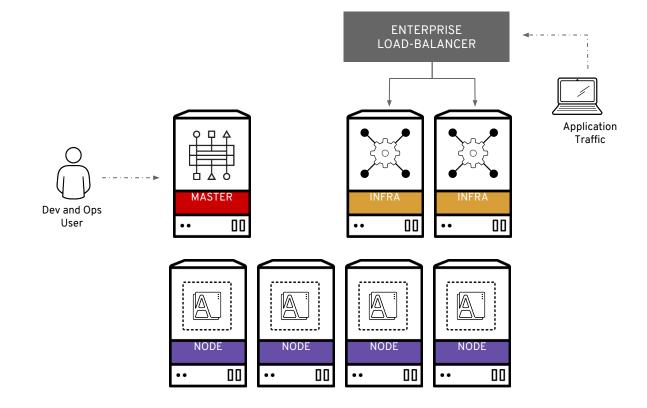

#### **Proof-of-Concept Architecture**

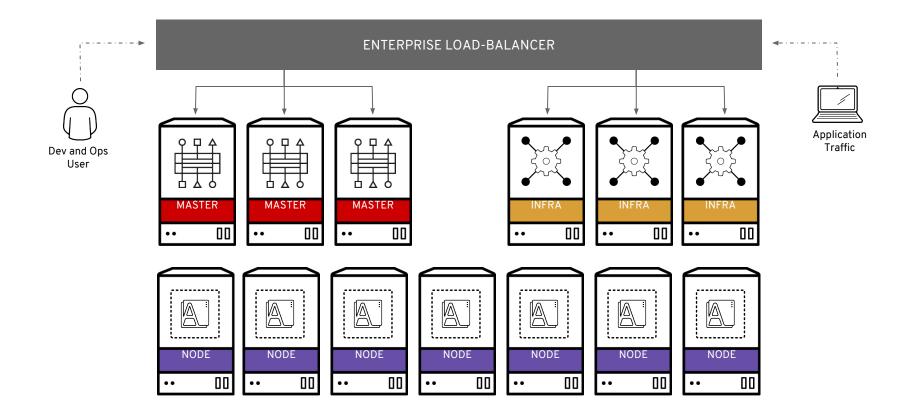

#### **High-Availability Architecture**

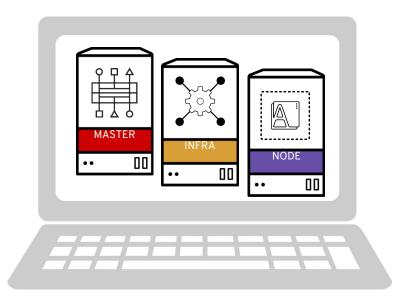

#### **Full High-Availability Architecture**

A laptop with at least 8GB of RAM to host the master, the infra and the compute nodes.

\$ oc cluster up --logging=false --metrics=true ...

#### LAB and Q/A (anytime you want/need)

What you need?

Internet

Root/Admin access to your PC

Docker

**JDK 1.8+** 

OC – OpenShift CLI tool

https://github.com/openshift/origin/releases

#### Presentation and labs available at:
